

New Improved Microburst 3000® Can

Innovation and continued product quality improvement is priority for Technical Concepts. As part of our quality improvement program, we have developed a new aluminum, seamless can which provides improved benefits for buyers and sellers of the Microburst 3000 odor control systems.

- Aluminum is a lighter material, making it easier to handle and store.
- The new can has NO seams, reducing the potential risk of leakage significantly.
- Made from aluminum, as opposed to steel, the cans are less prone to rust in humid conditions.
- The new aluminum can **fits in all the same dispensers** which the steel can fits.

Our fragrance formulations for the Microburst 3000 remain the same. Quality and safety are the standards of TC refill formulations. We guarantee the quality and consistency of each and every production run to the same exact formulation every time. All components used in our formulations meet RIFM (Research Industry for Fragrance Materials) and IFRA (International Fragrance Association) standards.

We will begin shipping the new can in February 2007. As we deplete inventory of the old style cans, there will be a period of around 2 to 3 months in which some fragrances will be shipped in the new can and some ship in the old can. As you may know, aluminum is more expensive than steel. We have developed a competitive sourcing strategy that allows us to use the aluminum can in the MB3000 format. Standard size refills as well as MB9000 refills will continue to be filled in steel cans.

I trust you will agree that the shift to the new MB3000 can is an excellent upgrade to a market leading product.
